Setup:

Before playing. Run the tomb4 setup program. To do so just hold down the control button (ctrl) on the keyboard. While still pressed, double click the tomb4.exe program. The setup box should appear.

Avoid 4k resolutions as the textures may appear grainy or distorted.

The following settings should work well with most systems. Afterwards click ok and the game should start automatically:

This game should work on older systems like windows 10 or earlier. You may need to reduce the resolution for older integrated graphics cards.

PC Controls:

Consult this website below for the basic moves, combo moves and Swimming controls in game:

Tomb Raider 4: The Last Revelation Controls - Stella's Tomb Raider Site

Known Issues:

Mesh line error on windows 11:

Running some custom levels on Windows 11 may cause mesh lines to appear on the objects. More noticeable on the Lara model's face. This is caused by modern graphics cards having effects that are not compatible with the old tomb4 program. To remove these mesh lines you will have to change the “Antialiasing” settings:

Locate your graphics card settings program.

Add a customised setting for **tomb4.exe** (Find the path of the custom level like `../desktop/TR4Gold/tomb4.exe`).

Change the “**Antialiasing mode**” settings for tomb4.exe to “**application controlled**”. Meaning that the tomb4.exe will control the antialiasing settings and not your graphics card's global settings.

Please do not save while using a key or puzzle item as upon loading the triggers that were activated by that item will no longer activate and you will be unable to complete the game. Please wait until afterwards to save.

Other Information:

This game is not compatible with FLEP as it may cause serious gameplay issues.

For any other unforeseen issues, please consult the Tomb Raider custom level forums/ discord channels first as the community is bound to have more knowledge concerning these issues than me.

Have fun playing Tomb Raider 4 Gold!
